MIDTERM 1 EXAM

Date: Tuesday, February 17 2015
Starting time: 10:30
Duration: 1 hour 20 minutes
Attention: **ANY TYPE OF COMMUNICATION IS STRICTLY PROHIBITED**
Please write down your name at the top of all used pages

5/18

Problem 1

Square arrays can be rotated by 90^0, say, in clock-wise direction. For example:

1	2	3	4	5
6	7	8	9	10
11	12	13	14	15
16	17	18	19	20
21	22	23	24	25

→

~~21~~	~~16~~	~~11~~	~~6~~	~~1~~
22	17	12	7	2
23	18	13	8	3
24	19	14	9	4
25	20	15	10	5

The easiest way to implement the rotation by 90^0 is to transpose the initial square array and then to reverse all its rows separately. Write a Java method ***void rotate(int[][] array2D)*** that takes as its argument a square ***int[][] array2D*** and rotates its. Use already implemented methods ***void reverse(int[] array1D)*** and ***void transpose(int[][] array2D)***:

```
public static void reverse(int[] array1D) {
      for (int i = 0; i < array1D.length / 2; i++) {
            array1D[array1D.length - 1 - i] += array1D[i];
            array1D[i] = array1D[array1D.length - 1 - i] - array1D[i];
            array1D[array1D.length - 1 - i] -= array1D[i];
      }
}

public static void transpose(int[][] array2D) {
      for (int row = 0; row < array2D.length; row++)
            for (int col = row + 1; col < array2D.length; col++) {
                  array2D[row][col] += array2D[col][row];
                  array2D[col][row] = array2D[row][col] - array2D[col][row];
                  array2D[row][col] -= array2D[col][row];
      }
}
```

```
Public static void rotate (int[][] array2D)
{
  transpose (array2D)
  for (j=0; i< array2D.length; j++)
      reverse (array1D) }.
```

Problem 3

Similar to files, strings also can be related to streams in C++, this time using ***stringstream*** objects. Particularly, it is enough to create an object of type ***istringstream*** to organize formatted reading from a string. Consider, for example, a C++ code below:

```
#include <string>
#include <sstream>
#include <iostream>
using namespace std;

void main()
{
	string text = "Before_increment: 199999999", word;
	int num;
	istringstream tokens(text);

	tokens >> word >> num;
	cout << "After " << word.substr(7) << num + 1 << endl;
}
// After increment:200000000
```

Write a C++ function ***double value(string expression)*** that takes as its argument a string representing an arithmetic expression, evaluates it and returns its value. The expression includes only '+' and '–' operations and double operands, both positive and negative. The operands and operations are delimited by spaces.

For example, ***value("5.1 – -0.7 + 1.2")*** results in *7.0*.

```
int grey;
Color [][] y = new Color [e[0] length] [e length];
for (int row = 0, row < y. length; row++) {
    for (int col=0; col < y[0] length; col++) {
        grey = (e [row] [col]. get Red() + e[row] [col] getGreen()+
                + e[row] [col], get +Blue())/3;
        y [row] [col] = new color(grey, grey, grey);
}
```
