COMP120 Introduction to Object-Oriented Programming

MIDTERM 1 EXAM

Date:

Tuesday, February 17 2015

Starting time:

10:30

Duration:

1 hour 20 minutes

Attention:

ANY TYPE OF COMMUNICATION IS STRICTLY PROHIBITED

Please write down your name at the top of all used pages

Problem 1

Square arrays can be rotated by 900, say, in clock-wise direction. For example:

1	2	3	4	5
6	7	8	9	10
11	12	13	14	15
16	17	18	19	20
21	22	23	24	25

	21	16	11	6	1
	22	17	12	7	2
>	23	18	13	8	3
	24	19	14	9	4
	25	20	15	10	5

11/18

The easiest way to implement the rotation by 900 is to transpose the initial square array and then to reverse all its rows separately. Write a Java method void rotate(int[][] array2D) that takes as its argument a square int[][] array2D and rotates its. Use already implemented methods void reverse(int[] array1D) and void transpose(int[][] array2D):

```
public static void reverse(int[] array1D) {
        for (int i = 0; i < array1D.length / 2; i++) {</pre>
               arraylD[arraylD.length - 1 - i] += arraylD[i];
              array1D[i] = array1D[array1D.length - 1 - i] - array1D[i];
              arraylD[arraylD.length - 1 - i] -= arraylD[i];
 public static void transpose(int[][] array2D) {
        for (int row = 0; row < array2D.length; row++)</pre>
              for (int col = row + 1; col < array2D.length; col++) {</pre>
                     array2D[row][col] += array2D[col][row];
                     array2D[col][row] = array2D[row][col] - array2D[col][row];
                     array2D[row][col] -= array2D[col][row];
public static void rotate (int[][] array=20) {
for (int i=0; i < array20.length; i++)
reverse (array20[i]);
     transpose (array 2D);
```

Problem 2

Colors in Java can be represented by objects of type *Color*. Each such object contains the *red*, *green* and *blue* components of the corresponding color as integer values from 0 to 255. Consider below a Java code that creates and initializes a rectangular array of *Color* type:

Continue with a Java code that creates another array Color[][] g of the same size and fills it with gray equivalents of the colors from the array Color[][] c. To get a grey equivalent of a given color c[i][j], it is enough to construct a Color object, whose red, green and blue components all are equal to the calculated average of red, green and blue components of the initial c[i][j]. Use $int\ getRed()$, $int\ getGreen()$ and $int\ getBlue()$ methods of class Color.

00p. MIJ. 140275.4092

Problem 3

Similar to files, strings also can be related to streams in C++, this time using *stringstream* objects. Particularly, it is enough to create an object of type *istringstream* to organize formatted reading from a string. Consider, for example, a C++ code below:

```
#include <string>
#include <sstream>
#include <iostream>
using namespace std;

void main()
{
        string text = "Before_increment: 199999999", word;
        int num;
        istringstream tokens(text);

        tokens >> word >> num;
        cout << "After " << word.substr(7) << num + 1 << endl;
}
// After increment:2000000000</pre>
```

Write a C++ function *double value(string expression)* that takes as its argument a string representing an arithmetic expression, evaluates it and returns its value. The expression includes only '+' and '-' operations and double operands, both positive and negative. The operands and operations are delimited by spaces.

For example, value("5.1 - -0.7 + 1.2") results in 7.0.

```
double value (string expression) {

int iz 1;

double answer = 0;

istringstream tokens (expression);

while (tokens >> parks) { type of post->

if (pout = = "+") } {

if (pout = = "-") {

while:

continu;

continu;

dee is if (pout = = "-") {

while:

y

return is ans;

3/4=0
