## MIDTERM 1 EXAM

Date:

Tuesday, February 17 2015

Starting time:

10:30

Duration:

1 hour 20 minutes

Attention:

ANY TYPE OF COMMUNICATION IS STRICTLY PROHIBITED

Please write down your name at the top of all used pages

## Problem 1

Square arrays can be rotated by 90°, say, in clock-wise direction. For example:

1	2	3	4	5
6	7	8	9	10
11	12	13	14	15
16	17	18	19	20
21	22	23	24	25

11	K Wilde directions						
	21	16	11	6	1		
	22	17	12	7	2		
	23	18	13	8	3		
	24	19	14	9	4		
	25	20	15	10	5		

11/18

The easiest way to implement the rotation by  $90^0$  is to transpose the initial square array and then to reverse all its rows separately. Write a Java method *void rotate(int[][] array2D)* that takes as its argument a square int[][] array2D and rotates its. Use already implemented methods void reverse(int[] array1D) and void transpose(int[][] array2D):

```
public static void reverse(int[] arraylD) {
     for (int i = 0; i < array1D.length / 2; i++) {</pre>
           array1D[array1D.length - 1 - i] += array1D[i];
           array1D[i] = array1D[array1D.length - 1 - i] - array1D[i];
           array1D[array1D.length - 1 - i] -= array1D[i];
                                                        00p. 1711. 130215 MIOF
public static void transpose(int[][] array2D) {
     for (int row = 0; row < array2D.length; row++)</pre>
           for (int col = row + 1; col < array2D.length; col++) {</pre>
                array2D[row][col] += array2D[col][row];
                array2D[col][row] = array2D[row][col] - array2D[col][row];
                array2D[row][col] -= array2D[col][row];
public static void rotate (int[][] array 2D) {
              array 2D= transpose(array 2D);
    for (int row 20=0; row 20 carray 20. length; row 20++)
             array20[row20] = reverse (currey20 (row 20));
                                                             4/6-0
```

See HChiSS, LHLHIAG

Colors in Java can be represented by objects of type *Color*. Each such object contains the *red*, *green* and *blue* components of the corresponding color as integer values from 0 to 255. Consider below a Java code that creates and initializes a rectangular array of *Color* type:

Color [][]g = new Color [in.nex+Int()] [in.nex+Int()]

for (int col=0; row < g. length; row ++) {
for (int col=0; col< g[0]. length; col++) {

John Control of the C

g [row] [col] = (got led (clow] [w1]) + get Green (ctrow] [w]) + get Blue (ctrow) [w]

Similar to files, strings also can be related to streams in C++, this time using stringstream objects. Problem 3 Particularly, it is enough to create an object of type istringstream to organize formatted reading from a string. Consider, for example, a C++ code below:

```
#include <string>
#include <sstream>
#include <iostream>
using namespace std;
void main()
      string text = "Before_increment: 199999999", word;
      int num;
      istringstream tokens(text);
      cout << "After " << word.substr(7) << num + 1 << endl;
      tokens >> word >> num;
// After increment:200000000
```

Write a C++ function double value(string expression) that takes as its argument a string representing an arithmetic expression, evaluates it and returns its value. The expression includes only '+' and '-' operations and double operands, both positive and negative. The operands and operations are delimited by spaces.

For example, value("5.1 - -0.7 + 1.2") results in 7.0.

```
double value (text)
double nums;
double num;
chur nark;
 istringstreem token s(text),
    tokens >> rums;
 uhile (tokens>> mark>> mem)
     f if (mark == 1+1)
           nums+= neem',
        else nums = = num;
 return-?
```
