COMP120 Introduction to Object-Oriented Programming

MIDTERM 1 EXAM

Date:

Tuesday, February 17 2015

Starting time:

10:30

Duration:

1 hour 20 minutes

Attention:

ANY TYPE OF COMMUNICATION IS STRICTLY PROHIBITED

Please write down your name at the top of all used pages

Problem 1

Square arrays can be rotated by 90°, say, in clock-wise direction. For example:

1	2	3	4	5
6	7	8	9	10
11	12	13	14	15
16	17	18	19	20
21	22	23	24	25

21	16	11	6	1
22	17	12	7	2
23	18	13	8	3
24	19	14	9	4
25	20	15	10	5

12/18

The easiest way to implement the rotation by 90° is to transpose the initial square array and then to reverse all its rows separately. Write a Java method *void rotate(int[][] array2D)* that takes as its argument a square *int[][] array2D* and rotates its. Use already implemented methods *void reverse(int[] array1D)* and *void transpose(int[][] array2D)*:

Problem 2

Colors in Java can be represented by objects of type Color. Each such object contains the red, green and blue components of the corresponding color as integer values from 0 to 255. Consider below a Java code that creates and initializes a rectangular array of Color type:

```
import java.util.Scanner;
import java.awt.Color;
public class Colors (
public static void main(String args[]) {
      Scanner in = new Scanner (System.in);
// Read number of rows and columns and create a Color array of such size
      Color[][] c = new Color[in.nextInt()][in.nextInt()];
// For each element read the red, green and blue components as integers and
// create a Color object by calling Color(int, int, int) constructor
      for (int row = 0; row < c.length; row++)
            for (int col = 0; col < c[0].length; col++)</pre>
                  c[row][col] = new Color(in.nextInt(), in.nextInt(), in.nextInt());
// TO BE CONTINUED
```

Continue with a Java code that creates another array Color[][] g of the same size and fills it with gray equivalents of the colors from the array Color[][] c. To get a grey equivalent of a given color c[i][j], it is enough to construct a Color object, whose red, green and blue components all are equal to the calculated average of red, green and blue components of the initial c[i][j]. Use int getRed(), int getGreen() and int

Color [] [] g = new Color [in.nextInt()][in.next Int()] getBlue() methods of class Color. for (int row=0; row < g. length; row++) { for (int eol=0, col < g [0]; col++)

g [row] [col] = nevor Color (in . next Int (), in next Int (), interext Int () int average = (g[row][col].getReol()+ g[row][col].getGreen()+ + g[row][evl]. getBlue())/3;

g [row][ad] = new Color (average, average, average),

Problem 3

Similar to files, strings also can be related to streams in C++, this time using stringstream objects. Particularly, it is enough to create an object of type istringstream to organize formatted reading from a string. Consider, for example, a C++ code below:

```
#include <string>
#include <sstream>
#include <iostream>
using namespace std;
void main()
      string text = "Before_increment: 199999999", word;
      int num;
      istringstream tokens(text);
      tokens >> word >> num;
      cout << "After " << word.substr(7) << num + 1 << endl;
// After increment:200000000
```

Write a C++ function double value(string expression) that takes as its argument a string representing an arithmetic expression, evaluates it and returns its value. The expression includes only '+' and '-' operations and double operands, both positive and negative. The operands and operations are delimited by spaces.

For example, value("5.1 - -0.7 + 1.2") results in 7.0.

void main () istringstream tokens (expression) double sign ; operand; Mail; tokens >> operand; west: operand; while (tokens >> rign>> operand) ? if (nign = = +) valent + = operand; if (sign = = '-1') World -= operand; cent >> Valte.

Use the backside, if needed
