COMP120 Introduction to Object-Oriented Programming

MIDTERM 1 EXAM

Date:

Tuesday, February 17 2015

Starting time:

10:30

Duration:

1 hour 20 minutes

Attention:

ANY TYPE OF COMMUNICATION IS STRICTLY PROHIBITED

Please write down your name at the top of all used pages

Problem 1

Square arrays can be rotated by 90° , say, in clock-wise direction. For example:

| 1 | 2 | 3 | 4 | 5 |
|----|----|----|----|----|
| 6 | 7 | 8 | 9 | 10 |
| 11 | 12 | 13 | 14 | 15 |
| 16 | 17 | 18 | 19 | 20 |
| 21 | 22 | 23 | 24 | 25 |

| | 21 | 16 | 11 | 6 | 1 |
|-------------|----|----|----|----|---|
| | 22 | 17 | 12 | 7 | 2 |
| > | 23 | 18 | 13 | 8 | 3 |
| | 24 | 19 | 14 | 9 | 4 |
| | 25 | 20 | 15 | 10 | 5 |

The easiest way to implement the rotation by 90° is to transpose the initial square array and then to reverse all its rows separately. Write a Java method *void rotate(int[][] array2D)* that takes as its argument a square *int[][] array2D* and rotates its. Use already implemented methods *void reverse(int[] array1D)* and *void transpose(int[][] array2D)*:

```
public static void reverse(int[] array1D) {
    for (int i = 0; i < array1D.length / 2; i++) {
            array1D[array1D.length - 1 - i] += array1D[i];
            array1D[i] = array1D[array1D.length - 1 - i] - array1D[i];
            array1D[array1D.length - 1 - i] -= array1D[i];
}

public static void transpose(int[][] array2D) {
    for (int row = 0; row < array2D.length; row++) {
            array2D[row][col] += array2D[col][row];
            array2D[row][col] - array2D[col][row];
            array2D[col][row] = array2D[row][col] - array2D[col][row];
    }
}

public static void rotate(int[][] array2D) {
            array2D = transpose(array2D);
            array2D[row] = reverse(array2D[row]);
}</pre>
```

Problem 2

Colors in Java can be represented by objects of type *Color*. Each such object contains the *red*, *green* and *blue* components of the corresponding color as integer values from 0 to 255. Consider below a Java code that creates and initializes a rectangular array of *Color* type:

```
Color[][] = new Color[c.length][c[0].length];

for (int row=0; row< g.length; row++) f

for (int col=0; col< g [0].length; col++) f

int a=(c [row][col].getRed()+

+c[row][col].getGreen()+c.[row][col].getBlue())/3;

g [row][col]=new (olor(a, a, a);
```

Problem 3

Similar to files, strings also can be related to streams in C++, this time using stringstream objects. Particularly, it is enough to create an object of type istringstream to organize formatted reading from a string. Consider, for example, a C++ code below:

```
#include <string>
#include <sstream>
#include <iostream>
using namespace std;
void main()
      string text = "Before_increment: 199999999", word;
      int num;
      istringstream tokens(text);
      tokens >> word >> num;
      cout << "After " << word.substr(7) << num + 1 << endl;</pre>
// After increment: 200000000
```

Write a C++ function double value(string expression) that takes as its argument a string representing an arithmetic expression, evaluates it and returns its value. The expression includes only '+' and '-' operations and double operands, both positive and negative. The operands and operations are delimited by spaces.

For example, value("5.1 - -0.7 + 1.2") results in 7.0.

```
double value (string expression)
  istringstream tokens (expression)
   char operation;
  while (tokens >> operation) If there is of to read !
      tokens > operation >> num;
       if (operation == "+") '+'
       if (operation == "-")'-1
          result -= num;
    return result
                                        £5 W/2
```
